Team Name: Signet

One line: What You're Building: trading agents with a provable record and a private strategy

Who is This For

a stock token bot operator on Robinhood Chain, like @HarmonicAgents (2,502 followers), who posts pool volume and has no way to show a follower which code is trading

What They Do Today

post a screenshot or a wallet link. 0 of 22 viral AI trading bot posts gave a wallet to check (@Meta_ZET, 7,321 followers)

Alternatives and Gaps

ARCANA: the platform holds the keys and prompts. Hyperliquid: 9,478 vaults, no proof of which code trades. Robinhood Agents: limits, no audit. Knidos: proves rules, not the model. Automata: verifies TDX quotes onchain (~4M gas), no trading account

The Wedge

the follower's account refuses every workload except the one it approved, so a trade belongs to code the follower chose

Why Now

Robinhood Agents launched on 2026-09-29 and states it does not audit agents. Stock Tokens became Morpho collateral on Oct 22 (https://x.com/RobinhoodCrypto/status/2113270580472381515)

Why Onchain, Why Arbitrum

the Stylus verifier walks Intel's cert chain in one tx anyone can replay: 2,584,842 gas to admit, 2,349,054 to refuse, 504,449 per attested trade. The Stock Tokens and the canonical Uniswap v4 pool live on Robinhood Chain

First 5-10 Users

@HarmonicAgents (2,502), Meridian402 (stock token market maker), @OxSimpleFarmer (28,443), @Agent_Minimum (470), @DeployFinance (7,295), @GrowiHF (1,592), @senpi_ai (14,741), @betashop (22,573), @the_nof1 (54,390). the first five get a dm this weekend with the TSLA receipt

Ship This Weekend

the measured compose pins the strategy's hash and the decision loop runs inside the enclave; that CVM is admitted on Robinhood Chain testnet (tx 0x5fdc4acb...965c). following leaves exactly one measurement approved. demo: the attested TSLA trade and a different workload refused, both read from the chain
